SUMMARY:

Software developer with professional experience building and maintaining financial web applications using Java, Spring Boot, and React.js at Vanguard and Infosys, currently pursuing a Master of Science in Artificial Intelligence. I bridge production-grade backend and frontend development with hands-on AI automation through my personal project Igris — a multi-tool AI assistant that integrates Claude, MCP, REST APIs, and human-in-the-loop workflows for email management, job tracking, and browser automation. I am drawn to the orchestration layer of AI systems: how agents, tools, and APIs coordinate securely, and how organizations can adopt AI responsibly without it feeling overwhelming. My goal is to design and deploy scalable, explainable AI-powered systems at real-world scale.

EDUCATION:

Concordia University, St. Paul, MN,

Master of Science in Information Technology Management

JAN 2023 – MAY 2024

Southwest Baptist University, Bolivar, MO

, Master of Science in Artificial Intelligence

JAN 2026 - PRESENT

SKILLS:

AI Tools: Claude, ChatGPT, Gemini, AI coding assistants, prompt writing, AI workflow design

AI Concepts: MCP, AI agents, AI orchestration, human-approved workflows, responsible AI, automation

Automation & Tools: APIs, REST APIs, Telegram bots, Gmail workflows, browser automation concepts, Git, GitHub, Maven, Jenkins, VS Code, Postman

Basic Technical Skills: ava, Spring Boot, React.js, Python, JavaScript, TypeScript, HTML, CSS, SQL, Oracle, MySQL, OAuth 2.0, JWT, JUnit

Communication: Explaining technical ideas simply, documentation, teamwork, fast learning, problem solving

PROJECTS:

Igris — Personal AI Assistant Project

- Designed and built a multi-tool AI assistant that connects Gmail, Telegram, browser automation, and local AI models into a single working workflow
- Integrated Claude and MCP to enable AI agents to interact with external APIs, files, and services in a coordinated way
- Built a human-approval layer into the workflow so sensitive actions like sending emails or applying to jobs require confirmation before executing
- Structured the project in modular components, allowing each part (email routing, job tracking, resume tailoring, Telegram notifications) to be tested and improved independently
- Designed the system to be explainable to non-technical users, with clear documentation and simple interaction patterns

AI Portfolio Website

Created a personal portfolio website to explain my AI learning journey, projects, resume, and contact information.

- Built a simple website to show my AI interests, projects, career goals, and resume.
- Used AI coding tools to improve the website content, fix layout issues, and make the design easier to understand.
- Organized the project information so recruiters and non-technical readers can quickly understand what I am learning and building.
- Designed the portfolio to support AI-related applications, LinkedIn profile updates, and fellowship opportunities like Claude Corps.

AI Tools and Automation Learning

- Developed hands-on proficiency with **Claude, ChatGPT, Gemini, MCP, and REST APIs** through practical project work, applying AI tools to solve real-world productivity challenges.
- Practiced **prompt engineering techniques** to optimize AI output quality for research, documentation, workflow design, and professional communication tasks.
- Explored **AI agent concepts** including task decomposition, tool use, memory management, and multi-step reasoning by building personal automation projects.
- Leveraged AI tools to streamline workflows such as **job tracking, email management, and content organization**, significantly reducing manual effort and improving efficiency.

PROFESSIONAL EXPERIENCE:

Client: Vanguard
Java Developer Intern / Junior Java Developer

Malvern, United States
AUG 2024 – SEP 2025

Project Description:

Supported the development and maintenance of a financial web application managing customer and account-related workflows. Contributed to Java backend development, frontend enhancements, REST API testing, and bug resolution while working under senior developer guidance in an Agile delivery environment.

Responsibilities:

- Developed and maintained backend modules using **Java and Spring Boot** for financial customer and account workflows, implementing assigned feature updates and enhancements.
- Built and updated **REST API endpoints** to support frontend integration and business requirements, ensuring accurate data exchange and reliable service communication.
- Implemented frontend changes using **React.js, HTML, CSS, and JavaScript**, improving page layouts, form validations, and overall user interface consistency.
- Performed **API testing and validation using Postman** to verify endpoint functionality, request/response accuracy, and integration stability.
- Wrote and optimized **SQL queries** for data retrieval, validation, and application support within the financial database environment.
- Identified, debugged, and resolved frontend and backend bugs during development and testing cycles, contributing to improved application stability.
- Authored **unit test cases** with guidance from senior developers to validate core functionality and maintain code quality standards.
- Managed source code using **Git**, adhering to team branching strategies and version control best practices.
- Collaborated with senior developers in **daily Agile stand-ups** to understand application architecture, coding standards, debugging techniques, and deployment processes.

Client: Infosys
Junior Software Developer / Software Engineer

Bengaluru, India
MAR 2022– DEC 2022

Project Description:

Enhancement of a legacy web application aimed at modernizing the user interface, improving application maintainability, and ensuring seamless integration between frontend and backend systems. The project involved updating legacy screens, resolving existing functionality issues, and establishing reliable data communication between React.js frontend and Java-based backend services.

Responsibilities:

- Developed and enhanced React.js UI components using HTML, CSS, and JavaScript to modernize legacy application screens, improving user interaction and interface consistency.
- Implemented Java and Spring Boot backend modifications and integrated frontend pages with REST APIs, enabling seamless data flow between the client and server layers.
- Identified, debugged, and resolved UI and functionality bugs while performing feature testing, contributing to improved application stability and reduced user-reported issues.
- Utilized Git for version control and supported build and deployment processes using Maven and Jenkins, facilitating efficient code integration and continuous delivery within an agile team environment.
