SUMMARY:

I'm an AI Master's student who builds the things I study. My personal project Igris connects Claude, MCP, APIs, and automation tools into a working assistant that manages emails, tracks job applications, sends Telegram notifications, and runs browser tasks with human approval steps baked in. I'm drawn to the orchestration layer: how AI tools talk to each other, how workflows are designed, and how organizations like nonprofits and schools can use AI without it feeling overwhelming or risky. My goal is to grow into someone who can design and run these systems at a real-world scale.

EDUCATION:

Concordia University, St. Paul, MN, Master of Science in Information Technology Management

Southwest Baptist University, Bolivar, MO, Master of Science in Artificial Intelligence

SKILLS:

AI Tools: Claude, ChatGPT, Gemini, AI coding assistants, prompt writing, AI workflow design

AI Concepts: MCP, AI agents, AI orchestration, human-approved workflows, responsible AI, automation

Automation & Tools: APIs, Telegram bots, Gmail workflows, browser automation concepts, GitHub, VS Code

Basic Technical Skills: Python, JavaScript, TypeScript, HTML, CSS, SQL

Communication: Explaining technical ideas simply, documentation, teamwork, fast learning, problem solving

PROJECTS:

Igris — Personal AI Assistant Project

Igris is a personal AI assistant project I am building to learn how AI agents and automation workflows can support real daily tasks. The goal of this project is to connect AI tools with services like Gmail, Telegram, browser automation, and local AI models in a simple and useful way.

- Built the idea and workflow for an AI assistant that can support email summaries, job tracking, resume support, Telegram updates, and task automation.
- Explored how AI tools like Claude, ChatGPT, MCP, APIs, and local AI models can work together in one workflow.
- Learned how MCP can help connect AI systems with tools, files, APIs, and outside services.
- Added a human-approval approach so important actions can be reviewed before they are completed.
- Practiced breaking a large AI project into smaller parts, testing each part, finding issues, and improving the workflow step by step.
- Focused on making the project easy to understand for both technical and non-technical users.

AI Portfolio Website

Created a personal portfolio website to explain my AI learning journey, projects, resume, and contact information.

- Built a simple website to show my AI interests, projects, career goals, and resume.
- Used AI coding tools to improve the website content, fix layout issues, and make the design easier to understand.
- Organized the project information so recruiters and non-technical readers can quickly understand what I am learning and building.
- Designed the portfolio to support AI-related applications, LinkedIn profile updates, and fellowship opportunities like Claude Corps.

AI Tools and Automation Learning

Hands-on learning project focused on understanding AI tools, prompt writing, automation workflows, and agent concepts.

- Practiced using Claude, ChatGPT, Gemini, MCP concepts, APIs, AI coding assistants, and prompt writing.
- Used AI tools for research, planning, documentation, communication, and workflow design.
- Learned how AI agents can help with tasks like summarizing information, organizing updates, drafting messages, and improving productivity.
- Practiced explaining AI tools and technical ideas in a simple way for people who may not have a technical background.
